

It's Simple really, ZeroSwap helps dEX by providing a very comfortable alternative to all the obvious advantages the centralized exchanges have over the Decentralized ones. By the End of this piece, It'll be clear how and why ZeroSwap is the way to go.

### **Multi chain**

Zero Swap will be multi-chain, that means it's operations will cut across chains starting from the binance smart chain and the etheruem blockchain, the platform not just allows users to switch between blockchains but when an order is placed, it sources between different chains to execute the order. This also ensures a quick execution or settlement of transactions because liquidity will be sourced across protocols and still trade on a decentralized environment.

ZeroSwap bridges that gap between different blockchains by being multichain, users can now use one interface, zeroswap, for their multichain transactions, for free.

### **Zero Trade Fees and Gasless fees**

The volatility of cryptocurrencies is the major reason some people haven't embraced the technology, coming on board and getting charged outrageous fees for gas and transactions is certainly not helping even though users have come to embrace the necessary evil.

Zero swap is set to be the first decentralized exchange in the globe to introduce gasless and chargeless transactions, the resultant effect of this is that users will not just keep hearing that a platform is user-centric, they'll see it play out with zero swap, a multichain platform which bares the cost of transactions using their own tokens will surely preach without words that what they do is indeed for the user.

### **Market Making Suite – Making transactions instant**

In a conventional decentralized exchange, for an exchange to occur, there needs to be two parties involved, one to release an asset and another party looking to acquire the same asset at the same time interval within the same price range, here, the system automatically executes the transaction when these two orders exist within the same price range and this process makes for a successful transaction.

However, in a centralized system, like binance, they are the market makers themselves, in other words, they already possess liquidity in the existing trading pairs. With that, when a user places a sell order, binance or any other centralized trading platform sells to them and charges a transaction fee. That makes transactions instant and as a result, users are willing to pay the fees just to get that satisfaction in of a speedy transaction.

With zero swap market-making suit and multi chain nature, Transactions are almost instant and beyond instant, cost is next to zero. That's one reason zeroswap is the future of decentralized exchange, setting the pace for something big that blockchain users across the globe will come to embrace when they know about it.

Zeroswap also runs a market making suit for DeFi tokens, this means that if a user wants to launch a Decentralized finance token, he/she can get empowered by zeroswap and get his or her token trading on the platform if the token meets standards, ZeroSwap provides liquidity for the tokens and they can trade instantly on the zeroswap multichain protocol

All the above features are ensuite in one interface, this is surely a project for every investor to jump on
